Database Structure

client: long id, string roleType ,string email, string password,Profile profile

profile: long id, Client client, string firstName...

message : long id; Client sender, Client recipient, String content...

Technologies

- ✓ RDS(AWS);
- ✓ Spring boot & Thymeleaf;
- ✓ Bootstrap & Materialize framework;
- ✓ Cloud hosting;
- ✓ Let's encrypt + Certbot + OpenSSL;

-- DAN WANG

Challenge and Solution

Thymeleaf Security: give different view for each role of user

```
<div sec:authorize="hasRole('ADMIN')" >
```

```
<div sec:authorize="hasRole('Client')"
```

Wizard — single form with jquery

Separate entity

IntelliJ and git

And debugging.....

Create Profile and Preference

1. Preference 2. Profile 3. Warning 4. Finish

Personal Information

First name *

Last name *

Choose your gender Male ▼

City *

City can not have special characters

Age *

The warning step will show up if age is less than 25

Height *

(*) Mandatory

Previous Next

-- Xin

Wizard query, validation

```
var form = $("#example-advanced-form").show();

form.steps({
  headerTag: "h3",
  bodyTag: "fieldset",
  transitionEffect: "slideLeft",
  onStepChanging: function (event, currentIndex, newIndex) {
    // Always allow previous action even if the current form is not valid!
    if (currentIndex > newIndex) {
      return true;
    }
    // Forbid next action on "Warning" step if the user is to young
    if (newIndex === 3 && Number($("#age-2").val()) < 25) {
      return false;
    }
    // Needed in some cases if the user went back (clean up)
    if (currentIndex < newIndex) {
      // To remove error styles
      form.find(".body:eq(" + newIndex + ") label.error").remove();
      form.find(".body:eq(" + newIndex + ") .error").removeClass("error");
    }
    form.validate().settings.ignore = ":disabled,:hidden";
    return form.valid();
  },
  onStepChanged: function (event, currentIndex, priorIndex) {
    // Used to skip the "Warning" step if the user is old enough.
    if (currentIndex === 2 && Number($("#age-2").val()) >= 25) {
      form.steps("next");
    }
    // Used to skip the "Warning" step if the user is old enough and wants to the previous step.
    if (currentIndex === 2 && priorIndex === 3) {
```

```
//relation to entity Client, fk = clientId
@OneToOne(fetch = FetchType.LAZY, optional = false)
@JoinColumn(name="clientId", nullable = false)
private Client client;

@Column(columnDefinition = "TIMESTAMP DEFAULT CURRENT_TIMESTAMP")
private LocalDateTime createdTS;

@Column(nullable = false, length = 30)
@Pattern(regexp = "[a-z A-Z]{1,30}", message = "Name can not have special characters")
private String firstName;

@Column(nullable = false, length = 30)
@Pattern(regexp = "[a-z A-Z]{1,30}", message = "Name can not have special characters")
private String lastName;

@Min(value=0, message = "Age should not be less than 0")
@Max(value=120, message = "Age should not be greater than 120")
@Column(nullable = false)
private int age;

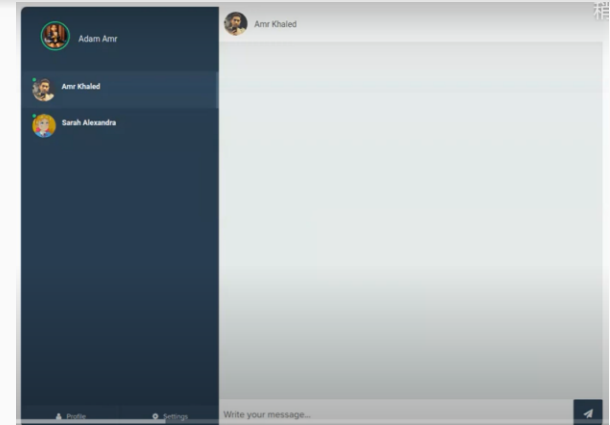

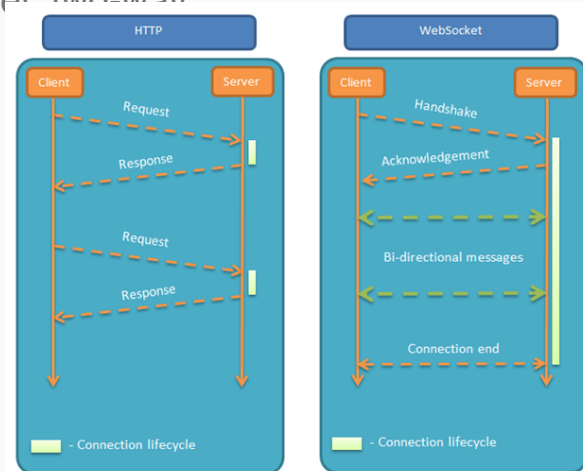

@Min(value = 80, message = "Height should not be less than 80 cm")
```

-- Xin

Solution for Chat feature (remove)

✓ Websocket for chat feature (instance message)

- Http protocol is a one-way protocol
- Websocket: two-way

-- Yuan Li

Solution for Message feature

- ✓ Leave message (asyn) solution
 - Message table
 - When user leave message
 - How can user receive notification
 - If I want to see the message history(remove)

What did we learn?

How to define if the client needs to do a profile wizard, or edit profile

```
<div sec:authorize="hasRole('Client')" th:object="${client}">
  <div th:if="${client.profile != null}">
    <a th:href="@{/edit_profile/{id}(id=${client.profile.id})}" class
  </div>
  <!-- ELSE -->
  <div th:if="${client.profile == null}">
    <a th:href="@{/wizard}" class="btn z-depth-0">Add Profile</a>
  </div>
</div>
```

```
@PreAuthorize(value="hasAnyRole('Client','ADMIN','VIP')")
@GetMapping("/home")
public ModelAndView ShowHomePage( Principal principal) {
    ModelAndView mav = profileService.getRecommendProfiles();
    Client client = clientService.findByEmail(principal.getName());
    mav.addObject( attributeName: "client", client);
    return mav;
}
```

-- XIN ZHAO

What did we learn?

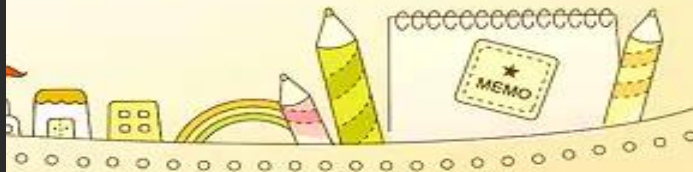

Change email as login username –user detail interface

Config where to change – httpsecurity http configure

```
@Override
public String getUsername() { return email; }
//email as username
```

```
.and() HttpSecurity
    .formLogin() FormLoginConfigurer<HttpSecurity>
    .loginPage("/login")
    .usernameParameter("email")
    .failureUrl("/login_err")
    .defaultSuccessUrl("/home")
```

Xin Zhao-

What did we learn?

✓ How to properly enable HTTPS on your server:

-- issue:

how to install certification the configuration file for the webserver

-- solution: openssl

❖ Reference:

<https://certbot.eff.org/instructions?ws=other&os=ubuntubionic>

https://www.openssl.org/docs/man3.0/man7/migration_guide.html

ING

What did we learn?

✓ How to deploy app to virtual server:

-- issue: choose an easier way

-- solution:

actuator + jar + maven + app.properties

❖ Reference:

<https://www.youtube.com/watch?v=W2Ccvpt4C3A>

-- DAN WANG

What did we learn?

✓ Use Principal to get current login user

Issue: need to know current user to get userid

Solution: Principal parameter

```
public String sendMessage(Long id, Message message, BindingResult bindingResult, RedirectAttributes redirectAttrs, Principal principal) {  
    if (bindingResult.hasErrors()) {  
        //redirectAttrs.addFlashAttribute("error", "Error: send failed.");  
        return "profile";  
    } else {  
  
        Client sender = clientRepository.findByEmail(principal.getName()).get();  
        message.setSender(sender);  
    }  
}
```

What did we learn?

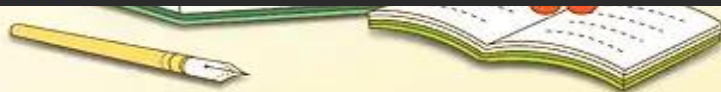

✓ `th:with="variable = ${object}"`

Issue: how to pass multi object to one form

Solution: define a tempory variable

```
<!--leave a message &dash-->
<div th:with ="currentProfile=${profile}">
  <form th:action="@{/send-message(pid=${profile.id})}" th:object="${message}" method="POST">
    <input type="text" th:field="*{content}" Placeholder="Write a message...."><br>
    <!-- <input type="hidden" th:field="*{content}" th:value="${currentProfile.client.firstname} +'said:'" ><br>-->
    <input class="waves-effect waves-light btn" type="submit" name="submit" value="Send">
  </form>
</div>
```

What did we learn?

✓ @Query

how to do complicated query, how to get random result

```
@Query(value = "select * from tbl_profile order by rand() limit ?3", nativeQuery = true)  
List <Profile> getRandomProfile(int num);
```

```
@Query(value = "select name,author,price from Book b where b.name like %:name%")  
List<Book> findByNameMatch(@Param("name") String name);
```

```
@Query(value = "select count(m) from Message m where m.status=:status AND m.recipient=:recipient")  
Integer findNewMsgNumberUsingJPA(@Param("status") String status, @Param("recipient") Client recipient);
```

Future work

- Add feature of payment;
- Add feature of logging by the third part application
- Email verification
- 3S image upload and download
- Show who like you and you like who list on current user profile page
- Recommendation
- show new notification number on header
- Message page (show message box with history)

Summary

Technology

RDS(AWS); Spring boot & Thymeleaf;
Bootstrap & Materialize framework;
Cloud hosting;
Let's encrypt + Certbot + OpenSSL;

Client
